Create a PDF (english) document to explain how the WWW lifecycle works

Browsers help us to see websites

The websites are not stocked in our computers, they are stock on servers. The communication between them is made by IP address

User open the browser and type in the search bar the URL of the webpage he want to access

A request is send to the DNS server to convert the webpage name to an IP address and then it give it back to client OS

The DNS server is like a phonebook for IP addresses

The OS replace the website name with the IP address

The request is send to the webserver. The webserver, that have a database, process the information and create a HTML response that contain JS, CSS, images, videos etc
